BioHorizons brings metal-free dental implant solution to U.S.

The entire system is metal-free, providing an alternative to traditional titanium implant systems.

BIRMINGHAM, Ala. — Nov. 2, 2026 — BioHorizons has introduced CERALOG® PROGRESSIVE-LINE implants to the U.S. market, a ceramic dental implant that is completely metal-free.

While most dental implants are made of titanium, some patients require an alternative. The introduction of CERALOG to the U.S. market allows doctors to meet the needs of more patients with a metal-free solution. When treatment calls for an alternative implant treatment solution, CERALOG provides the esthetics, stability and reliability a doctor needs for their workflow.

Key features include:

- **Fully metal-free solution:** Ceramic implant, zirconia/PEEK restorative components and metal-free screw
- **Two-piece restorative flexibility:** Provides restorative options beyond those available withtraditional one-piece ceramic implant designs
- **Bolt-in-tube implant-abutment connection:** Engineered to provide a stable, preciseconnection between the ceramic implant and restorative component
- **High-performance ceramic material:** Designed to provide the mechanical performance required for implant dentistry while delivering the esthetic benefits of a tooth-colored material

CERALOG merges a modern implant body design with completely metal-free restorative components to address the growing U.S. market for alternative implant solutions," said BioHorizons President & CEO Steve Boggan. "This new addition to our already broad implant product portfolio allows us to provide doctors with an even broader range of solutions for their patients."

Originally developed by partner company Camlog, CERALOG features a modern tapered, aggressive thread design and dedicated surgical instrumentation. By launching in the U.S., CERALOG expands the availability of metal-free implant treatment options.
